The findings cited in this report are based on a survey sponsored by the National Pest Management Association (NPMA) and Pest Control Technology (PCT). The purpose of this research project was to gather current data about compensation and benefits in the pest control industry.

The survey sample of 11,028 included all emailable contacts in the following two segments:

- primary company contacts in NPMA's membership list at unique company locations in the United States and Canada
- recipients of $P C T$ at unique company locations in the United States and Canada and with titles of executive, owner, partner, president, or vice president

On October 20, 2021, Readex contacted all sample members via an email in the name of NPMA's CEO and PCT's publisher, which included a link to the survey programmed/hosted by Readex, asking for their participation in the study. As an incentive to participate, respondents were eligible to receive a copy of the complete aggregated results (emailed by NPMA) and to enter into a drawing for a chance to win one of two $\$ 100$ Visa gift cards.

Reminder emails were sent on October 27, November 3, and November 10 to those with deliverable email addresses who had not yet responded.

The survey was closed for tabulation on November 15, 2021, with 448 total responses-a $4 \%$ response rate. To accurately represent the audience of interest, the results are based on the 435 qualified companies (those that reported they provide services in the U.S. or Canada) -representing $97 \%$ of the total population.

The margin of error for percentages based on 435 qualified companies is $\pm 4.6$ percentage points at the $95 \%$ confidence level. The margin of error for percentages based on smaller sample sizes will be larger.

As with any research, the results should be interpreted with the potential of non-response bias in mind. It is unknown how those who responded to the survey may differ from those who did not. In general, the higher the response rate, the more likely results are to accurately represent the population of interest

Percentages may not add to 100 for single answer questions due to rounding and/or non-response.

This report was prepared by Readex in accordance with accepted research standards and practices.

PURPOSE AND METHOD

Readex Research is a nationally recognized independent research company located in Stillwater, Minnesota. Its roots are in survey research for the magazine publishing industry, but specialization in conducting high-quality survey research (by mail and/or the Internet) has brought clients from many other markets, including associations, corporate marketers and communicators, and government agencies. Since its founding in 1947, Readex has completed thousands of surveys for hundreds of different clients.

As a full-service survey research supplier, Readex offers professional services, and in-house processing of all phases of each project (traditional mailing, broadcast emailing, and data processing) to ensure complete control over project quality and schedule. Analytical capabilities include a range of multivariate statistics and modeling techniques in addition to the more traditional stub-and-banner tabulations.

## HOW TO READ THE TABLES

The first column ("TOTAL") shows results for all respondents. Each column to the right represents a specific segment of respondents - for example, those with a job title/function of director

The circled result in the example below may be paraphrased as
"Among those with a job title/function of director, 57\% are current members of XYZ association."

Use caution when interpreting a column with a base value less than 30 ("C-suite" in the example above). Results based on fewer than 30 responses are not statistically sound, and should not be used to make inferences about that group.

[^1] are used in the calculations.

*The margin of error for results based on fewer than 30 responses cannot be meaningfully calculated and the results are considered statistically unstable.

| Segment | Description |
| :---: | :---: |
| TOTAL | all respondents |
| GROSS REVENUE | those reporting their company's gross revenue in the 12 months preceding July 12021 (including all locations) as: |
| <\$250k | under \$250,000 |
| \$250k - \$499k | \$250,000-\$499,999 |
| \$500k - \$999k | \$500,000-\$999,999 |
| \$1M+ | \$1.0 million or more |
| REGION SERVICED | those indicating their company services the following region: |
| Mideast/New England | Mideast only or New England only |
| Great Lakes \& Plains | Great Lakes \& Plains only |
| Southeast | Southeast only |
| Rocky Mtn/Far West/Southwest | Rocky Mountain only, Far West only, or Southwest only |
| Canada | Canada only |
| COMPANY NPMA MEMBERSHIP STATUS | when asked if their company currently is a member of the National Pest Management Association, those indicating: |
| member | yes |
| non-member | no |
| NUMBER OF EMPLOYEES | when asked, as of July 12021 (at all locations), approximately how many people (full-time, parttime, and seasonal) are employed at their company, those indicating: |
| $<10$ | less than 10 |
| 10+ | 10 or more |

[^0]:    Sales Manager: Value of Other Cash Compensation Received

[^1]:    In addition to percentages, three common summary statistics may be presented in this report for numeric variables.
    A mean is the arithmetic average of a distribution (i.e., a set of values). Because it is arithmetically calculated, it can be multiplied by the population represented to present a total volume estimate. For example, if 100 survey respondents (representing 10,000 people in the population) reported mean expenditures of $\$ 100$ each, total expenditures for that population are estimated as $10,000 \times \$ 100=\$ 1,000,000$. Means are very much influenced by extremely large or extremely small values in the distribution (e.g., one millionaire can substantially raise an estimate of average income). Means for grouped data are calculated using the midpoint of each range. The lowest-valued group is represented by its largest value; the highest-valued group by its lowest

    The standard error measures the variability associated with the survey's estimate of a population mean. The standard error is analogous to the margin of error associated with percentages: that is, $95 \%$ of the time we expect the true (unknown) population mean to be within plus-or-minus two standard errors of the mean calculated from the sample. A standard error that is large in proportion to the mean indicates a high level of statistical instability; trending and projections against such estimates should be undertaken cautiously

    A median is the value that lies at the middle of a distribution: that is, $50 \%$ of the values are above it and $50 \%$ are below. It represents the "typical" response, and is not influenced by extreme values. For most distributions, the median will be either roughly equal to, or significantly smaller than the mean. Medians for grouped data are calculated by locating the group which contains the 50th percentile, then interpolating between the lower and upper bounds to estimate the precise value. Only the values listed above the statistics on a data table
