

BuildingPoint is a Trimble-supported network of select team members who have proven track records as supportive partners for the construction industry. BuildingPoint Canada has been selected by Trimble to support Canada's design-build-operate lifecycle for contractors and construction managers for solutions that merge cutting-edge innovation and practical requirements. BuildingPoint will solve today's wants and needs within the construction industry – and help you keep doing your job better.

Construction layout and field solutions

Field and mobility solutions include applications and hardware for field layout. The equipment and tools capture data from the field and deliver it to the office for productivity, progress, and quality assurance.

CrewSight improves visibility into the costs of labour on building construction projects. It provides the ability to clearly see and analyze the actual hours crews are on site, what zones of the site crews are working and ensure that everyone on site has proper clearance to be there.

3D Laser scanning

3D Laser scanning is used by contractors and project managers for pre-construction as-builts, Building Information Modeling (BIM), virtual design and construction for needs such as quality control during construction or floor flatness analysis.

Project Management

Trimble ProjectSight keeps contractors and subs in sync throughout the building process. Keeping building construction projects on track requires smart workflows and tight collaboration from start to finish.

Prolog provides cost control; streamlining the project information workflow and providing access to information from anywhere. Prolog Mobile enables all project participants to capture and retrieve project information on mobile devices that are affordable and available to everyone.

Estimating

Trimble GCEstimator Suite incorporates best-of-breed estimating and takeoff solutions designed to increase efficiencies, win more work, and maximize the profitability of projects before, during and after construction. With a single knowledge-base that captures your company's estimating methods, your work will be delivered faster and with absolute confidence.

VDC and Professional Services

VDC Services covers the BIM gamut – from 2D drawing comparison to 3D modeling and coordination; creating a BIM model from a laser scan point cloud; 3D quantity takeoff to full 5D estimating; 4D schedule optimization to owner presentation materials; and every step in-between. Call us to discuss the level of detail you need and we will arrange to meet your highest standards.
